

BOOK UP: An Online Book Trading App

INSTALLING THE SOFTWARE

All the files which needs to downloaded are located at
<https://github.com/kdagnes/cs-191-project/tree/master/01-Project-Documents/Codes>

DATABASE

For the database, you must be able to launch phpMyAdmin. If you haven't set up your username and password, you may read first the "read_after_install-english.txt" located at the Wamp directory.

Once you've logged in to phpMyAdmin, create a database named "bookup" or your preferred database name. The database name matters as it will be used in scripts to access your database.

When the database has been created, from the link given above, import the "bookup.sql" into the database. The SQL files contains the tables and table columns.

PHP CODES

The rest of the files in the github should be downloaded and placed in the "www" directory of Wampserver. It is important to note that you must configure the codes based on your phpMyAdmin username and password, and mySQL database name. To access the website using the localhost, put this link in your browser
[http://localhost/<book folder\(optional\)>/home.php](http://localhost/<book folder(optional)>/home.php).
