

# BOOK UP: An Online Book Trading App

## SETTING UP THE DEVELOPMENT ENVIRONMENT

### **WAMP SERVER**

The application was developed using WampServer, a free and intuitive Windows web development environment. The application utilized PHP and MySQL database which are included in the WampServer installation.

To install WampServer, navigate and find the Downloads page in their Website <http://www.wampserver.com/en/>. You may choose which file version depending on the OS you are using, then open or run the file you've downloaded. Then there will be a series of instructions that you need to follow. Once WampServer is installed, you can manually add PHP and MySql versions.

To use the WampServer, the “www” directory will be automatically created. This is the directory where the PHP files will be placed. From there, you can click on the “localhost” link in the WampServer menu or open your internet browser and go to the URL <http://localhost>.
